PROFILE

Computing Science graduate from the University of Alberta (2026) who builds and ships AI features, cloud services, and data tools. Three internship summers, a portfolio of tested working code, and open to relocating across Canada.

EDUCATION

University of Alberta

Bachelor of Science, Computing Science

Edmonton, AB

Sep. 2021 – Jun. 2026

- **Relevant Coursework:** Machine Learning, Software Engineering, Data Structures & Algorithms, Databases, Operating Systems, Natural Language Processing, Search & Planning in AI, Web Applications & Architecture

EXPERIENCE

iTechArabian

Software Engineering Intern

Dubai, UAE

Summers 2023, 2024 & 2025

- Built AI chatbots that answer customer questions from each client's own help content, handling about 40% of routine inquiries without staff.
- Developed an AI feature that forecasts what supplies a hotel group should order, cutting forecast error about 15% against manual estimates.
- Wrote an AI service that drafts marketing copy for client teams, from request to release.
- Worked on an Agile (Scrum) team through the full development cycle, with every change peer-reviewed before it shipped.

PROJECTS

Docket | reads and files receipts automatically (TypeScript, AWS, Lambda, DynamoDB)

GitHub | Demo | 2026

- Built a pipeline on AWS that reads uploaded receipts, pulls out the key details, strips personal information, and files them.
- Reading stays over 99.8% accurate on a fixed set of test receipts, and any change that drops below is blocked.
- Deployed it once to a live cloud account, checked it worked on a real receipt, then shut it down.
- Added monitoring, alerts, a spending cap, and a recovery path so failures get caught and replayed.

Tarn | finds suspicious patterns in over a billion logins (Python, Spark, SQL, Neo4j)

GitHub | Demo | 2026

- Sped up the slowest processing step about 22% by benchmarking two AI-drafted fixes and keeping the faster one.
- Turned raw login histories into daily behavior summaries for more than 80,000 accounts.
- Modeled the results into reporting tables, with every key checked automatically on each change.

Tally | a banking service that keeps every transfer balanced to the cent (Java, PostgreSQL, JUnit)

GitHub | 2026

- Wrote a banking service in Java that records both sides of every transfer, so the books always balance.
- Covered it with over 250 automated tests, from unit checks to full runs against a real database, on every change.
- Made repeated transfers safe, so a dropped-then-retried request never charges a customer twice.

TECHNICAL SKILLS

Languages: Python, Java, TypeScript, SQL, C++, JavaScript, Go

AI & Data: LLM integration, fine-tuning (LoRA), RAG, vector search (FAISS), model evaluation, Amazon Bedrock, PySpark, dbt

Cloud & Backend: AWS (Lambda, API Gateway, DynamoDB, S3, CDK), REST APIs, FastAPI, React, Node.js, PostgreSQL, Docker, Linux

Testing & Practices: Unit, integration & performance testing, JUnit, pytest, CI (GitHub Actions), debugging, code review, Agile / Scrum, software development lifecycle, Git
